Fill this out on your own first! Use the monster animation on the web page to guide your answers.

1) The variable we are using is called:

_____

2) How many times do you need to click on the monster before he jumps?

_____

Here is a list of things that are happening in the script. Put a number next to each instruction to figure out the order in which it happens. The checkmark column (✓) is to keep track of what steps you programmed and the order.

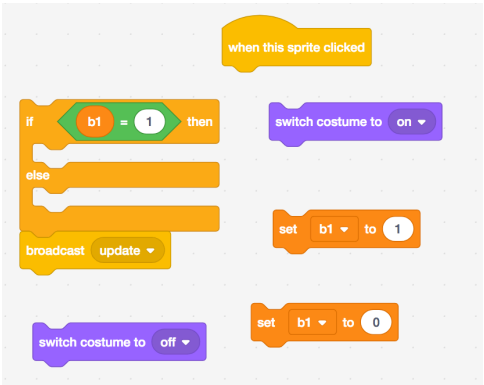
Operation	Step #	✓
Switch costume to		
Wait half a second	5	
Switch costume to		
Glide to y = 10 over one second (keep x the same)		
Switch costume to 		
Glide to y = -10 over one second (keep x the same)		
set jumpcount to 0		

Parity Challenge Instructions

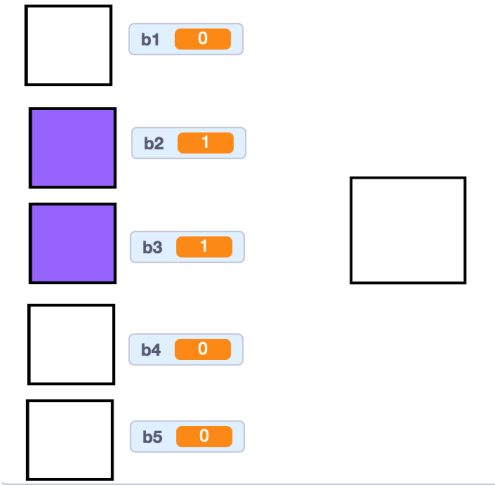
1) Go to the b1 sprite and fix its code. You should only need to use the blocks already on the canvas.

   If the “b1” variable is set to off (0), when you click on it, it should turn on

   And same deal in reverse



2) If you have this working, duplicate the b1 sprite 4 more times. Change the program for each of those so that the second sprite works with b2, the third with b3 and so on. It will look something like this if you’ve clicked on b2 and b3:



3) Finally, fix the code for the parity bit. All the blocks you need are there. Just make them work for even or odd. The operator “mod” means “divide by the number and tell me what the remainder is.” So 7 mod 3 gives you 1 (3 can go into 7 twice with 1 as a remainder).
